

# Verifying Snapping Mechanism - Floating Point Implementation Version

Jiawen Liu

March 22, 2020

In order to verify the differential privacy property of an implementation of the snapping mechanism [5], we follow the logic rules designed from [1] and the floating point error semantics from [7, 4, 2, 6].

## 1 Preliminary Definitions

### Definition 1 (Laplace mechanism [3])

Let  $\epsilon > 0$ . The Laplace mechanism  $\mathcal{L}_\epsilon: \mathbb{R} \rightarrow \text{Distr}(\mathbb{R})$  is defined by  $\mathcal{L}(t) = t + v$ , where  $v \in \mathbb{R}$  is drawn from the Laplace distribution  $\text{laplce}(\frac{1}{\epsilon})$ .

## 2 Syntax - IMP

Programs	$p$	$::=$	$x = e \mid x \stackrel{\$}{\leftarrow} \mu \mid p; p$
Expr.	$e$	$::=$	$r \mid c \mid x \mid f(D) \mid e * e \mid \circ(e)$
Binary Operation	$*$	$::=$	$+ \mid - \mid \times \mid \div$
Unary Operation	$\circ$	$::=$	$\ln \mid - \mid \lfloor \cdot \rfloor \mid \text{clamp}_B(\cdot)$
Value	$v$	$::=$	$r \mid c$
Distribution	$\mu$	$::=$	$\text{laplce} \mid \text{unif} \mid \text{bernoulli}$
Error	$err$	$::=$	$(e, e)$
Transaction Env.	$\Theta$	$::=$	$\cdot \mid \Theta[x \mapsto (e, err)]$

## 3 Semantics - IMP

The transition semantics with relative floating point computation error are shown in Figure. 1 for programs. The semantics are  $\Theta, p \Rightarrow \Theta'$ , which means a real computation programs  $p$  with environment  $\Theta$  can be transited in floating point computation with error bound for all variables in  $\Theta'$ ,  $\eta$  is the machine epsilon.

$$\begin{array}{c}
\frac{\Theta(x) = (e, (\underline{e}, \bar{e}))}{\Theta, x \Rightarrow (e, (\underline{e}, \bar{e}))} \text{VAR} \quad \frac{r \geq 0}{\Theta, r \Rightarrow (r, (\frac{r}{(1+\eta)}, r(1+\eta)))} \text{VAL} \quad \frac{c = \text{fl}(r) \quad r < 0}{\Theta, r \Rightarrow (r, (r(1+\eta), \frac{r}{(1+\eta)}))} \text{VAL-NEG} \\

Figure 4: Semantics of Evaluation in Real Computation

**Theorem 1 (Soundness Theorem)**

For any  $p$ , if there exists a transition  $\Theta, p \Rightarrow \Theta'$  and  $\Theta$  is a bounded transaction environment (i.e.,  $\forall x \in \text{dom}(\Theta)$  s.t.  $\Theta(x) = (e, (\underline{e}, \bar{e}))$ , if  $e \Downarrow^{\mathbb{F}} c$ ,  $\underline{e} \Downarrow^{\mathbb{R}} \underline{r}$  and  $\bar{e} \Downarrow^{\mathbb{R}} \bar{r}$ , then  $\underline{r} \leq c \leq \bar{r}$ ), then  $\forall x \in \text{dom}(\Theta')$  s.t.  $\Theta'(x) = (e, (\underline{e}, \bar{e}))$ , if  $e \Downarrow^{\mathbb{F}} c$ ,  $\underline{e} \Downarrow^{\mathbb{R}} \underline{r}$  and  $\bar{e} \Downarrow^{\mathbb{R}} \bar{r}$ , then:

$$\underline{r} \leq c \leq \bar{r}$$

*Proof.* Induction on transition rule of  $p$ , by assumption, we know  $\Theta$  is a safe environment ( $\star$ ).

**case**

$$\frac{\Theta, p_1 \Rightarrow \Theta_1 \quad \Theta_1, p_2 \Rightarrow \Theta_2}{\Theta, p_1; p_2 \Rightarrow \Theta_2} \text{CONSQ}$$

We need to show  $\Theta_2$  is a bounded environment.

Since we know  $\Theta$  is a bounded environment by assumption ( $\star$ ), by induction hypothesis, we have:

$\Theta_1$  and  $\Theta_2$  are all bounded environment. This case is proved.

**case**

$$\frac{c \leftarrow \mu^\diamond}{\Theta, x \xleftarrow{\$} \mu \Rightarrow \Theta[x \mapsto (c, (c, c))]} \text{SAMPLE}$$

We need to show  $\Theta[x \mapsto (c, (c, c))]$  is a safe environment.

Since we know  $\Theta$  is a safe environment by assumption ( $\star$ ). It is trivial that  $c \leq c \leq c$ . We can know  $\Theta[x \mapsto (c, (c, c))]$  is also a safe environment.

**case**

$$\frac{\Theta, e \Rightarrow (e, \text{err})}{\Theta, x = e \Rightarrow \Theta[x \mapsto (e, \text{err})]} \text{ASG}$$

We need to show:  $\Theta[x \mapsto (e, \text{err})]$  is a safe environment.

By assumption ( $\star$ ) we know:  $\Theta$  is already a safe environment. We still need to show:

Let  $\text{err} = (\underline{e}, \bar{e})$ ,  $e \Downarrow^{\mathbb{F}} c$ ,  $\underline{e} \Downarrow^{\mathbb{R}} \underline{r}$  and  $\bar{e} \Downarrow^{\mathbb{R}} \bar{r}$ ,  $\underline{r} \leq c \leq \bar{r}$ .

Induction on transition of  $e$ , we have:

**subcase**

$$\frac{\Theta(x) = (e, (\underline{e}, \bar{e}))}{\Theta, x \Rightarrow (e, (\underline{e}, \bar{e}))} \text{VAR}$$

By the assumption, we have  $\forall x \in \text{dom}(\Theta)$  s.t.  $\Theta(x) = (e, (\underline{e}, \bar{e}))$ ,  $e \Downarrow^{\mathbb{F}} c$ ,  $\underline{e} \Downarrow^{\mathbb{R}} \underline{r}$  and  $\bar{e} \Downarrow^{\mathbb{R}} \bar{r}$ ,  $\underline{r} \leq c \leq \bar{r}$ . This case is proved.

**subcase**

$$\frac{r \geq 0}{\Theta, r \Rightarrow (r, \frac{r}{(1+\eta)}, r(1+\eta))} \text{VAL}$$

By evaluation rule of floating point computation for  $r$ , we have:

$$\frac{\text{fl}(r) = c}{r \Downarrow^{\mathbb{F}} c} \text{ RVAL}$$

By the definition of floating point rounding error and  $r \geq 0$ , we have:  $\frac{r}{(1+\eta)} \leq c \leq r(1+\eta)$

**subcase**

$$\frac{c = \text{fl}(r) \quad r < 0}{\Theta, r \Rightarrow (r, r(1+\eta), \frac{r}{(1+\eta)})} \text{ VAL-NEG}$$

By evaluation rule of floating point computation for  $r$ , we have:

$$\frac{\text{fl}(r) = c}{r \Downarrow^{\mathbb{F}} c} \text{ RVAL}$$

By the definition of floating point rounding error and  $r < 0$ , we have:  $r(1+\eta) \leq c \leq \frac{r}{(1+\eta)}$

**subcase**

$$\frac{r = \text{fl}(r)}{\Theta, r \Rightarrow (r, r, r)} \text{ VAL-EQ}$$

Given  $r \Downarrow^{\mathbb{F}} c$ , it is trivial to show  $r \leq c = \text{fl}(r) = r \leq r$

**subcase**

$$\frac{}{\Theta, f(D) \Rightarrow (f(D), (f(D), f(D)))} \text{ F(D)}$$

Given  $f(D) \Downarrow c$  in both floating point and real computation, it is trivial to show  $c \leq c \leq c$

**subcase**

$$\frac{\begin{array}{l} \Theta, e^1 \Rightarrow (e, (e^1, \bar{e}^1)) \ (\diamond) \quad \Theta, e^2 \Rightarrow (e, (e^2, \bar{e}^2)) \ (\Delta) \\ \bar{e}, \underline{e} = \max, \min(e^1 * e^2, \bar{e}^1 * \bar{e}^2, e^1 * \bar{e}^2, \bar{e}^1 * e^2) \quad e^1 * e^2 \geq 0 \ (\square) \end{array}}{\Theta, e^1 * e^2 \Rightarrow (e^1 * e^2, (\frac{\underline{e}}{(1+\eta)}, (\bar{e})(1+\eta)))} \text{ BOP}$$

We need to show: for  $e^1 * e^2 \Downarrow^{\mathbb{F}} c$ ,  $\frac{\underline{e}}{(1+\eta)} \Downarrow^{\mathbb{R}} \underline{r}$  and  $(\bar{e})(1+\eta) \Downarrow^{\mathbb{R}} \bar{r}$ , the  $\underline{r} \leq c \leq \bar{r}$  holds.

By induction hypothesis on  $(\diamond)$  and  $(\Delta)$ , we have:

(1) for  $e^1 \Downarrow^{\mathbb{F}} c_1$ ,  $e^1 \Downarrow^{\mathbb{R}} \underline{r}_1$  and  $\bar{e}^1 \Downarrow^{\mathbb{R}} \bar{r}_1$ , the  $\underline{r}_1 \leq c_1 \leq \bar{r}_1$  holds.

(2) for  $e^2 \Downarrow^{\mathbb{F}} c_2$ ,  $e^2 \Downarrow^{\mathbb{R}} \underline{r}_2$  and  $\bar{e}^2 \Downarrow^{\mathbb{R}} \bar{r}_2$ , the  $\underline{r}_2 \leq c_2 \leq \bar{r}_2$  holds.

Let  $\bar{r}' = \min(\bar{r}_2 * \bar{r}_1, \underline{r}_2 * \bar{r}_1, \bar{r}_2 * \underline{r}_1, \underline{r}_2 * \underline{r}_1)$  and  $\underline{r}' = \max(\bar{r}_2 * \bar{r}_1, \underline{r}_2 * \bar{r}_1, \bar{r}_2 * \underline{r}_1, \underline{r}_2 * \underline{r}_1)$

By (1) and (2), we have:  $\underline{r}' \leq c_2 * c_1 \leq \bar{r}'$ .

By hypothesis  $(\square)$  and relative error of floating point rounding, we have:

$$\frac{\underline{r}'}{1+\eta} \leq \text{fl}(c_2 * c_1) \leq (\bar{r}')(1+\eta).$$

By evaluation rule FBOP and RBOP, we have:

$$e^1 * e^2 \Downarrow^{\mathbb{F}} \text{fl}(c_2 * c_1), \frac{\underline{e}}{(1+\eta)} \Downarrow^{\mathbb{R}} \frac{\underline{r}'}{1+\eta} \text{ and } (\bar{e})(1+\eta) \Downarrow^{\mathbb{R}} (\bar{r}')(1+\eta).$$

This case is proved.

subcase

$$\frac{\Theta, e^1 \Rightarrow (e, (e^1, \bar{e}^1)) \quad \Theta, e^2 \Rightarrow (e, (e^2, \bar{e}^2)) \quad \bar{e}, \underline{e} = \max, \min(e^1 * e^2, \bar{e}^1 * \bar{e}^2, e^1 * \bar{e}^2, \bar{e}^1 * e^2) \quad e^1 * e^2 < 0}{\Theta, e^1 * e^2 \Rightarrow (e^1 * e^2, (\bar{e})(1 + \eta), \frac{\underline{e}}{(1 + \eta)})} \text{BOP-NEG}$$

We need to show: for  $e^1 * e^2 \Downarrow^F c$ ,  $(\underline{e})(1 + \eta) \Downarrow^R \underline{r}$  and  $\frac{\bar{e}}{(1 + \eta)} \Downarrow^R \bar{r}$ , the  $\underline{r} \leq c \leq \bar{r}$  holds.

By induction hypothesis on  $(\diamond)$  and  $(\Delta)$ , we have:

(1) for  $e^1 \Downarrow^F c_1$ ,  $\underline{e}^1 \Downarrow^R \underline{r}_1$  and  $\bar{e}^1 \Downarrow^R \bar{r}_1$ , the  $\underline{r}_1 \leq c_1 \leq \bar{r}_1$  holds.

(2) for  $e^2 \Downarrow^F c_2$ ,  $\underline{e}^2 \Downarrow^R \underline{r}_2$  and  $\bar{e}^2 \Downarrow^R \bar{r}_2$ , the  $\underline{r}_2 \leq c_2 \leq \bar{r}_2$  holds.

Let  $\bar{r}' = \min(\bar{r}_2 * \bar{r}_1, \underline{r}_2 * \bar{r}_1, \bar{r}_2 * \underline{r}_1, \underline{r}_2 * \underline{r}_1)$  and  $\underline{r}' = \max(\bar{r}_2 * \bar{r}_1, \underline{r}_2 * \bar{r}_1, \bar{r}_2 * \underline{r}_1, \underline{r}_2 * \underline{r}_1)$

By (1) and (2), we have:  $\underline{r}' \leq c_2 * c_1 \leq \bar{r}'$ .

By hypothesis  $(\square)$  and relative error of floating point rounding, we have:

$$\underline{r}'(1 + \eta) \leq \text{fl}(c_2 * c_1) \leq \frac{\bar{r}'}{1 + \eta}.$$

By evaluation rule FBOP and RBOP, we have:

$$e^1 * e^2 \Downarrow^F \text{fl}(c_2 * c_1), \underline{e}(1 + \eta) \Downarrow^R \underline{r}'(1 + \eta) \text{ and } \frac{\bar{e}}{(1 + \eta)} \Downarrow^R \frac{\bar{r}'}{1 + \eta}.$$

This case is proved.

subcase

$$\frac{\Theta, e \Rightarrow (e, \underline{e}, \bar{e}) \ (\diamond) \quad \circ(e) \geq 0 \ (\square)}{\Theta, \circ(e) \Rightarrow (\circ(e), \frac{\circ(\underline{e})}{(1 + \eta)}, (\circ(\bar{e}))(1 + \eta))} \text{UOP}$$

We need to show: for  $\circ(e) \Downarrow^F c$ ,  $\frac{\circ(\underline{e})}{(1 + \eta)} \Downarrow^R \underline{r}$  and  $\circ(\bar{e})(1 + \eta) \Downarrow^R \bar{r}$ , the  $\underline{r} \leq c \leq \bar{r}$  holds.

By induction hypothesis on  $(\diamond)$ , we have:

(1) for  $e \Downarrow^F c'$ ,  $\underline{e} \Downarrow^R \underline{r}'$  and  $\bar{e} \Downarrow^R \bar{r}'$ , the  $\underline{r}' \leq c \leq \bar{r}'$  holds.

By (1) and monotone of unary operations, we have:  $\circ(\underline{r}') \leq \circ(c') \leq \circ(\bar{r}')$ .

By hypothesis  $(\square)$  and relative error of floating point rounding, we have:

$$\frac{\circ(\underline{r}')}{1 + \eta} \leq \text{fl}(\circ(c')) \leq \circ(\bar{r}')(1 + \eta).$$

By evaluation rule FBOP and RBOP, we have:

$$\circ(c') \Downarrow^F \text{fl}(\circ(c')), \frac{\circ(\underline{e})}{1 + \eta} \Downarrow^R \frac{\circ(\underline{r}')}{1 + \eta} \text{ and } \circ(\bar{e})(1 + \eta) \Downarrow^R \circ(\bar{r}')(1 + \eta).$$

This case is proved.

subcase

$$\frac{\Theta, e \Rightarrow (e, \underline{e}, \bar{e}) \quad \circ(e) < 0}{\Theta, \circ(e) \Rightarrow (\circ(e), (\circ(\underline{e}))(1 + \eta), \frac{\circ(\bar{e})}{(1 + \eta)})} \text{UOP-NEG}$$

We need to show: for  $\circ(e) \Downarrow^F c$ ,  $\circ(\underline{e})(1 + \eta) \Downarrow^R \underline{r}$  and  $\frac{\circ(\bar{e})}{(1 + \eta)} \Downarrow^R \bar{r}$ , the  $\underline{r} \leq c \leq \bar{r}$  holds.

By induction hypothesis on  $(\diamond)$ , we have:

(1) for  $e \Downarrow^F c'$ ,  $\underline{e} \Downarrow^R \underline{r}'$  and  $\bar{e} \Downarrow^R \bar{r}'$ , the  $\underline{r}' \leq c \leq \bar{r}'$  holds.

By (1) and monotone of unary operations, we have:  $\circ(\underline{r}') \leq \circ(c') \leq \circ(\bar{r}')$ .

By hypothesis  $(\square)$  and relative error of floating point rounding, we have:

$$\circ(\underline{r}')(1 + \eta) \leq \text{fl}(\circ(c')) \leq \frac{\circ(\bar{r}')}{1 + \eta}.$$

By evaluation rule FBOP and RBOP, we have:

$$\circ(c') \Downarrow^F \text{fl}(\circ(c')), \circ(\underline{e})(1 + \eta) \Downarrow^R \circ(\underline{r}')(1 + \eta) \text{ and } \frac{\circ(\bar{e})}{1 + \eta} \Downarrow^R \frac{\circ(\bar{r}')}{1 + \eta}.$$

Let  $c = \text{fl}(\circ(c'))$ ,  $\underline{r} = \circ(\underline{r}')(1 + \eta)$  and  $\bar{r} = \frac{\circ(\bar{r}')}{1 + \eta}$ , this case is proved.

## 4 Snapping Mechanism

**Definition 2** ( $\text{Snap}(a) : A \rightarrow \text{Distr}(\mathbb{R})$ )

Given privacy parameter  $\epsilon$ , the Snapping mechanism  $\text{Snap}(a)$  is defined as:

$$U \xleftarrow{\$} \mu; S \xleftarrow{\$} \{-1, 1\}; y = f(a) + S \times \ln(U) \div \epsilon; z = \text{clamp}_B(\lfloor y \rfloor_\Lambda)$$

where  $F$  is a primitive query function over input database  $a \in A$ ,  $\epsilon$  is the privacy budget,  $B$  is the clamping bound and  $\Lambda$  is the rounding argument satisfying  $\lambda = 2^k$  where  $2^k$  is the smallest power of 2 greater or equal to the  $\frac{1}{\epsilon}$ .

Let  $\text{Snap}'(a)$  be the same as  $\text{Snap}(a)$  given  $U, S$  without rounding and clamping steps, i.e.,  $\text{Snap}'(a) : y = f(a) + S \times \ln(U) \div \epsilon$ .

Let  $\text{Snap}''(a)$  be the same as  $\text{Snap}(a)$  given  $U, S$ , i.e.,  $\text{Snap}''(a) : \text{Snap}'(a); z = \text{clamp}_B(\lfloor y \rfloor_\Lambda)$ .

## 5 Main Theorem

### Theorem 2 (The Snap mechanism is $\epsilon$ -differentially private)

Consider  $\text{Snap}(a)$  defined as before, if  $\text{Snap}(a) = x$  given database  $a$  and privacy parameter  $\epsilon$ , then its actual privacy loss is bounded by  $\epsilon + 23B\epsilon\eta$ .

*Proof.* Given  $\text{Snap}(a) = x$  and parameter  $\epsilon$ , we consider  $a'$  be the adjacent database of  $a$  satisfying  $|f(a) - f(a')| \leq 1$ . Without loss of generalization, we assume  $f(a) + 1 = f(a') \ (\diamond)$ .

Consider the  $\text{Snap}(a)$  outputting the same result  $x$  under floating point and real computation, let  $(L, R)$  be the range where  $\forall u \in (L, R)$  and some  $s$  s.t.:

$$[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{R}} [z \mapsto x].$$

We have  $\Pr[\text{Snap}(a) = x] = R - L$ . Since the  $\text{Snap}(a)$  is  $\epsilon$ -DP, we can get:

$$e^{-\epsilon} \leq \frac{\Pr[\text{Snap}(a)]}{\Pr[\text{Snap}(a')]} = \frac{R - L}{R' - L'} \leq e^{\epsilon}$$

Let  $(l, r)$  be the range where  $\forall u \in (l, r)$  and some  $s$  s.t.:

$$[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x].$$

To show the privacy loss of Snap mechanism in floating point computation is bounded by  $\epsilon + 23B\epsilon\eta$ , it's sufficient to show:  $|r - l|$  is bounded  $f(|R - L|)$  and  $g(|R - L|)$  s.t.:

$$-(\epsilon + 23B\epsilon\eta) \leq \ln\left(\frac{f(|R - L|)}{g(|R - L|)}\right) \leq \epsilon + 23B\epsilon\eta.$$

Induction on the outputspace of  $\text{Snap}(a)$  mechanism, we have following cases:

#### case $x = -B$

Let  $b$  be the largest number rounded by  $\Lambda$  that is smaller than  $B$ ,  $b' = b - \Lambda/2$ .

Let  $L$  and  $R$  be the range where  $\forall u \in (L, R)$  and  $s = 1$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{R}} [z \mapsto x]$ .

Let  $l$  and  $r$  be the range where  $\forall u \in (l, r)$  and  $s = 1$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x]$ .

So we know  $s = 1$ ,  $l = L = 0$ ,  $\underline{R} < r < \bar{R}$  s.t.:

$$[U \mapsto r, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto -b'] \wedge [U \mapsto R, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{R}} [y \mapsto -b'].$$

The derivation of this case given  $\Theta = [U \mapsto (R, (\underline{R}, \bar{R})), S \mapsto (1, (1, 1))]$  is shown as following:

UOP

$$\begin{array}{c} \frac{}{\Theta, U \Rightarrow (R, (\underline{R}, \bar{R}))} \text{VAL-EQ} \\ \hline \text{BOP} \\ \Theta, \ln(U) \Rightarrow (\ln(R), \ln(\underline{R})(1 + \eta), \frac{\ln(\bar{R})}{(1 + \eta)}) \\ \hline \text{BOP} \\ \Theta, \frac{1}{\epsilon} \times \ln(U) \Rightarrow (\frac{1}{\epsilon} \times \ln(R), ((\frac{1}{\epsilon} \times \ln(\underline{R}))(1 + \eta)^2, \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1 + \eta)^2})) \\ \hline \text{ID} \\ \Theta, f(a) + \frac{1}{\epsilon} \times \ln(U) \Rightarrow \left( f(a) + \frac{1}{\epsilon} \times \ln(R), \left( (f(a) + (\frac{1}{\epsilon} \times \ln(\underline{R}))(1 + \eta)^2)(1 + \eta), \frac{(f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1 + \eta)^2})}{(1 + \eta)} \right) \right) \\ \hline \Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto \left( f(a) + \frac{1}{\epsilon} \times \ln(R), \left( (f(a) + (\frac{1}{\epsilon} \times \ln(\underline{R}))(1 + \eta)^2)(1 + \eta), \frac{(f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1 + \eta)^2})}{(1 + \eta)} \right) \right)] \end{array}$$

In the same way, we have the derivation for  $\text{Snap}'(a')$ :

$$\begin{array}{c} \dots \\ \hline \Theta, \text{Snap}'(a'); \text{Snap}'' \Rightarrow \Theta[y \mapsto (\text{Snap}'(a'), ((f(a') + (\frac{1}{\epsilon} \times \ln(\underline{R}'))(1+\eta)^2)(1+\eta), \frac{(f(a') + \frac{\frac{1}{\epsilon} \times \ln(\bar{R}')}{(1+\eta)^2})}{(1+\eta)})] \end{array}$$

Given  $\text{Snap}(a') \Downarrow^{\mathbb{F}} -b'$ ,  $\text{Snap}(a) \Downarrow^{\mathbb{F}} -b'$ , we have the worst case lower and upper bounds for  $R$  and  $R'$ , which are  $\underline{R}, \bar{R}, \underline{R}'$  and  $\bar{R}'$ :

$$\begin{aligned} \underline{R} &= e^{\epsilon((-b'(1+\eta)-f(a))(1+\eta)^2)}, \bar{R} = e^{\epsilon(\frac{(-b' - f(a))}{(1+\eta)^2})} \\ \underline{R}' &= e^{\epsilon((-b'(1+\eta)-f(a'))(1+\eta)^2)}, \bar{R}' = e^{\epsilon(\frac{(-b' - f(a'))}{(1+\eta)^2})} \end{aligned}$$

The privacy loss of  $\text{Snap}(a)$  in this case is bounded by:

$$\begin{aligned} \frac{\frac{1}{2}(\bar{R}-0)}{\frac{1}{2}(\underline{R}'-0)} &= e^{\epsilon\left(\frac{(-b' - f(a))}{(1+\eta)^2} - ((-b'(1+\eta)-f(a'))(1+\eta)^2)\right)} \\ &= e^{\epsilon\left(\frac{-b'}{(1+\eta)^3} - \frac{f(a)}{(1+\eta)^2} - x(1+\eta)^3 + f(a')(1+\eta)^2\right)} \quad (\star) \end{aligned}$$

Since  $(1+\eta)^3 > 1+3\eta$ ,  $\frac{1}{(1+\eta)^3} < \frac{1}{1+3\eta}$ ,  $(1+\eta)^2 < 1+2.1\eta$  and  $\frac{1}{(1+\eta)^2} > 1-2\eta$ , we have:

$$\begin{aligned} (\star) &< e^{\epsilon\left(\frac{9\eta+6}{1+3\eta}b' + 4.1\eta f(a) + (1+2.1\eta)\right)} \\ &< e^{\epsilon(10.1\eta B + 1 + 2.1\eta)} \end{aligned}$$

**case  $x \in (-B, \lfloor f(a) \rfloor_{\Lambda})$**

**subcase  $\lfloor f(a) \rfloor_{\Lambda} \leq 0 \vee (\lfloor f(a) \rfloor_{\Lambda} > 0 \wedge x \in (-B, 0))$**

Let  $y_1 = x - (\frac{\Lambda}{2})$ ,  $y_2 = x + (\frac{\Lambda}{2})$ , we know  $y_1 < 0$ ,  $y_2 < 0$ .

Let  $L = e^{\epsilon(y_1 - \bar{f}(a))}$  and  $R = e^{\epsilon(y_2 - f(a))}$ , we have:  $\forall u \in (L, R): [U \mapsto u, S \mapsto 1], \text{Snap}''(a) \Downarrow^{\mathbb{R}} [z \mapsto x]$ .

Let  $l$  and  $r$  be the range where  $\forall u \in (l, r)$  and  $s = 1$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x]$ .

So we know:  $\underline{L} < l < \bar{L}$ ,  $\underline{R} < r < \bar{R}$  s.t.:

$$[U \mapsto l, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_1] \wedge [U \mapsto r, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_2].$$

The transition from  $R$  to  $r$  given the transition environment  $\Theta = [U \mapsto (R, (\underline{R}, \bar{R})), S \mapsto (1, (1, 1))]$

is shown as following:

LN

$$\begin{array}{c}
\frac{}{\Theta, R \Rightarrow (R, (\underline{R}, \bar{R}))} \text{VAL-EQ} \\
\hline
\text{OP} \\
\Theta, \ln(U) \Rightarrow (\ln(R), (\ln(\underline{R})(1+\eta), \frac{\ln(\bar{R})}{(1+\eta)})) \\
\hline
\text{OP} \\
\Theta, \frac{1}{\epsilon} \times \ln(U) \Rightarrow (\frac{1}{\epsilon} \times \ln(R), ((\frac{1}{\epsilon} \times \ln(\underline{R}))(1+\eta)^2, \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1+\eta)^2})) \\
\hline
\text{ID} \\
\Theta, f(a) + \frac{1}{\epsilon} \times \ln(U) \Rightarrow \left( f(a) + \frac{1}{\epsilon} \times \ln(R), \left( (f(a) + (\frac{1}{\epsilon} \times \ln(\underline{R}))(1+\eta)^2)(1+\eta), \frac{(f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1+\eta)^2})}{(1+\eta)} \right) \right) \\
\hline
\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(R), (e^1, e^2))]
\end{array}$$

From soundness theorem, we have  $e^1 \leq y_2 \leq e^2$ , where we can get:

$\underline{R} = e^{\epsilon((y_1(1+\eta) - f(a))(1+\eta)^2)}$  and  $\bar{R} = e^{\epsilon(\frac{y_2}{1+\eta} - f(a))}$ . The transition from  $L$  to  $l$  given the transition environment  $\Theta = [U \mapsto (L, (\underline{L}, \bar{L})), S \mapsto (1, (1, 1))]$  is shown as following:

$$\begin{array}{c}
\dots \\
\hline
\Theta, \text{Snap}'(a) \Rightarrow \Theta[z \mapsto (f(a) + (\frac{1}{\epsilon} \times \ln(\underline{L})), (\frac{f(a) + (\frac{1}{\epsilon} \times \ln(\underline{L}))(1+\eta)^2}{1+\eta}, (f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{L})}{(1+\eta)^2})(1+\eta))]
\end{array}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ .

Taking the lower bound, we have:  $\underline{L} = e^{\epsilon((y_2(1+\eta) - f(a))(1+\eta)^2)}$ .

Taking the upper bound, we have:  $\bar{L} = e^{\epsilon(\frac{y_2}{1+\eta} - f(a))}$ .

In the same way, we have the bound of  $l, r$  for adjacent data set  $a'$ :

$$\begin{aligned}
\underline{R}' &= e^{\epsilon((y_1(1+\eta) - f(a'))(1+\eta)^2)}, \quad \bar{R}' = e^{\epsilon(\frac{y_1}{1+\eta} - f(a'))} \\
\underline{L}' &= e^{\epsilon((y_2(1+\eta) - f(a'))(1+\eta)^2)}, \quad \bar{L}' = e^{\epsilon(\frac{y_2}{1+\eta} - f(a'))}
\end{aligned}$$

Then, we have the privacy loss is bounded by:

$$\frac{|\bar{R} - \underline{L}|}{|\underline{R}' - \bar{L}'|}$$

We also have:

$$\begin{aligned}
\frac{\bar{R}}{\underline{L}} &= e^{\epsilon(\frac{y_1}{(1+\eta)^3} - \frac{f(a)}{(1+\eta)^2} - y_1 + f(a))} \leq e^{\epsilon(-\frac{3\eta}{1+3\eta}y_1 + 2\eta f(a))} \leq e^{\epsilon(\frac{3\eta}{1+3\eta}B + 2\eta B)} \leq e^{5\epsilon B\eta} \\
\frac{\underline{L}}{\bar{L}} &= e^{\epsilon(y_2(1+\eta)^3 - f(a)(1+\eta)^2 - y_2 + f(a))} \geq e^{\epsilon(3\eta y_1 - 2\eta f(a))} \geq e^{-5\epsilon B\eta}
\end{aligned}$$

Then, we can derive:

$$\begin{aligned}
|\bar{R} - \underline{L}| &\leq e^{5\epsilon B\eta} R - e^{-5\epsilon B\eta} L \\
&= L(e^{\Lambda\epsilon + 5\epsilon B\eta} - e^{-5\epsilon B\eta}) \\
&= L(e^{\Lambda\epsilon} e^{5\epsilon B\eta} - e^{5\epsilon B\eta} + e^{5\epsilon B\eta} - e^{-5\epsilon B\eta}) \\
&= L(e^{\Lambda\epsilon} e^{5\epsilon B\eta} - e^{5\epsilon B\eta} + \frac{1}{(e^{\Lambda\epsilon} - 1)}(e^{\Lambda\epsilon} - 1)e^{5\epsilon B\eta} - e^{-5\epsilon B\eta}) \\
&\leq L(e^{\Lambda\epsilon} e^{5\epsilon B\eta} - e^{5\epsilon B\eta} + \frac{1}{(e^{\Lambda\epsilon} - 1)}(e^{\Lambda\epsilon} - 1)e^{5\epsilon B\eta} - e^{-5\epsilon B\eta}) \text{ (by } 1 \leq \Lambda\epsilon < 2) \\
&= L \frac{e}{(e^{\Lambda\epsilon} - 1)} (e^{\Lambda\epsilon} e^{5\epsilon B\eta} - e^{5\epsilon B\eta} - e^{-5\epsilon B\eta}) \\
&< L \frac{e}{(e^{\Lambda\epsilon} - 1)} (e^{\Lambda\epsilon} e^{5\epsilon B\eta} - e^{5\epsilon B\eta}) \\
&= L(e^{\Lambda\epsilon} - 1) e^{\ln(\frac{e}{(e^{\Lambda\epsilon} - 1)}) + 5\epsilon B\eta} \\
&< L(e^{\Lambda\epsilon} - 1) e^{11\epsilon B\eta} \text{ (by } (\frac{1}{\epsilon} < B < 2^{42} \frac{1}{\epsilon})) \\
&= (R - L) e^{11\epsilon B\eta}
\end{aligned}$$

In the same way, we can derive:

$$|\underline{R} - \bar{L}| > e^{-5\epsilon B\eta} R - e^{5\epsilon B\eta} L > (R - L) e^{-12\epsilon B\eta}$$

Then we have:

$$\frac{|\bar{R} - \underline{L}|}{|\underline{R}' - \bar{L}'|} < e^{(23\epsilon B\eta + \epsilon)}.$$

**subcase**  $\lfloor f(a) \rfloor_{\Lambda} > 0 \wedge x \in (0, \lfloor f(a) \rfloor_{\Lambda})$

Let  $y_1 = x - (\frac{\Lambda}{2})$ ,  $y_2 = x + (\frac{\Lambda}{2})$ , we know  $y_1 > 0$ ,  $y_2 > 0$ .

Let  $S = 1$ ,  $L = e^{\epsilon(y_1 - f(a))}$  and  $R = e^{\epsilon(y_2 - f(a))}$ , we have  $\forall u \in (L, R)$ :  $[U \mapsto u, S \mapsto 1], \text{Snap}''(a) \Downarrow^{\mathbb{R}} [z \mapsto x]$ .

Let  $l$  and  $r$  be the range where  $\forall u \in (l, r)$  and  $s = 1$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x]$ .

We know:  $\underline{L} < l < \bar{L}$ ,  $\underline{R} < r < \bar{R}$  s.t.:

$$[U \mapsto l, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_1] \wedge [U \mapsto r, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_2].$$

The transition from  $L$  to  $l$  given the transition environment  $\Theta = [U \mapsto (L, (\underline{L}, \bar{L})), S \mapsto (1, (1, 1))]$  is shown as following:

$$\begin{array}{c}
\Theta, U \Rightarrow (L, (\underline{L}, \bar{L})) \\
\hline
\Theta, \ln(U) \Rightarrow (\ln(L), (\ln(\underline{L})(1 + \eta), \frac{\ln(\bar{L})}{(1 + \eta)})) \\
\hline
\Theta, \frac{1}{\epsilon} \times \ln(U) \Rightarrow (\frac{1}{\epsilon} \times \ln(L), ((\frac{1}{\epsilon} \times \ln(\underline{L}))(1 + \eta)^2, \frac{\frac{1}{\epsilon} \times \ln(\bar{L})}{(1 + \eta)^2})) \\
\hline
\Theta, f(a) + \frac{1}{\epsilon} \times \ln(U) \Rightarrow (f(a) + \frac{1}{\epsilon} \times \ln(l), (\frac{f(a) + (\frac{1}{\epsilon} \times \ln(\underline{L}))(1 + \eta)^2}{1 + \eta}, (f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{L})}{(1 + \eta)^2})(1 + \eta))) \\
\hline
\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(L), (err_1, err_2))]
\end{array}$$

From soundness theorem, we have  $err_1 \leq y_1 \leq err_2$ , then we can get:

$\underline{L} = e^{(y_1/(1+\eta) - f(a))(1+\eta)^2\epsilon}$  and  $\bar{L} = e^{(y_1/(1+\eta) - f(a))\epsilon/(1+\eta)^2}$ . The transition from  $R$  to  $r$  given the transition environment  $\Theta = [U \mapsto (R, (\underline{R}, \bar{R})), S \mapsto (1, (1, 1))]$  is shown as following:

$$\begin{array}{c}
\dots \\
\hline
\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(R), (\frac{f(a) + (\frac{1}{\epsilon} \times \ln(\underline{R}))(1 + \eta)^2}{1 + \eta}, (f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1 + \eta)^2})(1 + \eta)))]
\end{array}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ .

Taking the lower bound (i.e.  $err_1 = y_2$ ), we have:  $\underline{R} = e^{(y_2/(1+\eta)-f(a))(1+\eta)^2\epsilon}$ . Taking the upper bound (i.e.  $err_2 = y_1$ ), we have:  $\bar{R} = e^{(y_2(1+\eta)-f(a))\epsilon/(1+\eta)^2}$ .

For the adjacent input  $a$ , we first have the same setting as input  $a$  for  $R'$  and  $L'$ . Then the transition from  $L'$  to  $\bar{L}'$  given the transition environment  $\Theta = [U \mapsto (L', (\underline{L}', \bar{L}')), S \mapsto (1, (1, 1))]$  is shown as following:

$$\frac{\dots}{\Theta, \text{Snap}'(a') \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(L'), (\frac{f(a') + (\frac{1}{\epsilon} \times \ln(\underline{L}'))(1+\eta)^2}{1+\eta}, (f(a') + \frac{\frac{1}{\epsilon} \times \ln(\bar{L}')}{(1+\eta)^2})(1+\eta)))]}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ .

Taking the lower bound (i.e.  $err_1 = y_1$ ), we get:  $\underline{L}' = e^{(y_1/(1+\eta)-f(a'))(1+\eta)^2\epsilon}$ . Taking the upper bound (i.e.  $err_2 = y_1$ ), we get:  $\bar{L}' = e^{(y_1(1+\eta)-f(a'))\epsilon/(1+\eta)^2}$ . The transition from  $R'$  to  $\bar{R}'$  given the transition environment  $\Theta = [U \mapsto (R', (\underline{R}', \bar{R}')), S \mapsto (1, (1, 1))]$  is shown as following:

$$\frac{\dots}{\Theta, \text{Snap}'(a') \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(R'), (\frac{f(a') + (\frac{1}{\epsilon} \times \ln(\underline{R}'))(1+\eta)^2}{1+\eta}, (f(a') + \frac{\frac{1}{\epsilon} \times \ln(\bar{R}')}{(1+\eta)^2})(1+\eta)))]}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ .

Taking the lower bound (i.e.  $err_1 = y_2$ ), we have:  $\underline{R}' = e^{(y_2/(1+\eta)-f(a'))(1+\eta)^2\epsilon}$ . Taking the upper bound (i.e.  $err_2 = y_1$ ), we have:  $\bar{R}' = e^{(y_2(1+\eta)-f(a'))\epsilon/(1+\eta)^2}$ .

We have the privacy loss is bounded by:

$$\frac{|\bar{R} - \underline{L}|}{|\underline{R}' - \bar{L}'|}$$

Since the following bound can be proved by using  $1 - 2\eta < (1 + \eta)^2 < 1 + 2.1\eta$ ,  $y_1 > -B$ ,  $y_2 > -B$  and simple approximation:

$$\bar{R} - \underline{L} < (R - L)e^{(5B\eta\epsilon)}, \underline{R}' - \bar{L}' > (R' - L')e^{-7B\eta\epsilon}$$

We also have the  $\text{Snap}(a)$  is  $\epsilon$ -dp:

$$\frac{|R - L|}{|R' - L'|} = e^\epsilon$$

So we can get:

$$\frac{|\bar{R} - \underline{L}|}{|\underline{R}' - \bar{L}'|} < \frac{|R - L|}{|R' - L'|} e^{(12B\eta\epsilon)} = e^{(1+12B\eta)\epsilon}$$

**subcase**  $[f(a)]_\Lambda > 0 \wedge x = 0$

Let  $y_1 = x - (\frac{\Lambda}{2})$ ,  $y_2 = x + (\frac{\Lambda}{2})$ , we know  $y_1 < 0$ ,  $y_2 > 0$ .

Let  $S = 1$ ,  $L = e^{\epsilon(y_1 - f(a))}$  and  $R = e^{\epsilon(y_2 - f(a))}$ , we have  $\forall u \in (L, R)$ :  $[U \mapsto u, S \mapsto 1], \text{Snap}''(a) \Downarrow^{\mathbb{R}} [z \mapsto x]$ .

Let  $l$  and  $r$  be the range where  $\forall u \in (l, r)$  and  $s = 1$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x]$ .  
We know:  $\underline{L} < l < \bar{L}$ ,  $\underline{R} < r < \bar{R}$  s.t.:

$$[U \mapsto l, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_1] \wedge [U \mapsto r, S \mapsto 1], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_2].$$

The transition from  $L$  to  $l$  given the transition environment  $\Theta = [U \mapsto (L, (\underline{L}, \bar{L})), S \mapsto (1, (1, 1))]$  is shown as following:

$$\frac{\dots}{\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(\underline{L}), (\frac{f(a) + (\frac{1}{\epsilon} \times \ln(\underline{L}))(1+\eta)^2}{1+\eta}, (f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{L})}{(1+\eta)^2})(1+\eta)))]}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ .

Taking the lower bound, we have:  $\underline{L} = e^{((y_2(1+\eta) - f(a))(1+\eta)^2)}$ .

Taking the upper bound, we have:  $\bar{L} = e^{\frac{(\frac{y_2}{1+\eta} - f(a))}{(1+\eta)^2}}$ . The transition from  $R$  to  $r$  given the transition environment  $\Theta = [U \mapsto (R, (\underline{R}, \bar{R})), S \mapsto (1, (1, 1))]$  is shown as following:

$$\frac{\dots}{\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(\underline{R}), (\frac{f(a) + (\frac{1}{\epsilon} \times \ln(\underline{R}))(1+\eta)^2}{1+\eta}, (f(a) + \frac{\frac{1}{\epsilon} \times \ln(\bar{R})}{(1+\eta)^2})(1+\eta)))]}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ . Taking the lower bound (i.e.  $err_1 = y_2$ ), we have:  $\underline{R} = e^{(y_2/(1+\eta) - f(a))(1+\eta)^2 \epsilon}$ . Taking the upper bound (i.e.  $err_2 = y_1$ ), we have:  $\bar{R} = e^{(y_2(1+\eta) - f(a))\epsilon/(1+\eta)^2}$ . Using the bound we proved before, we have the folloing bound on  $|\bar{R} - \underline{L}|$  and  $|\underline{R} - \bar{L}|$ :

$$\begin{aligned} \bar{R} - \underline{L} &< e^{(2B\eta\epsilon)} R - e^{-5B\eta\epsilon} L < (R - L)e^{6B\eta\epsilon} \\ \underline{R} - \bar{L} &> e^{(-3B\eta\epsilon)} R - e^{5B\eta\epsilon} L > (R - L)e^{-8B\eta\epsilon}, \end{aligned}$$

and privacy loss is bounded by:

$$\frac{|\bar{R} - \underline{L}|}{|\underline{R} - \bar{L}|} < e^{14B\eta\epsilon + \epsilon}$$

**case  $x = \lfloor f(a) \rfloor_{\Lambda}$**

This case can also be split into 3 subcases by:  $\lfloor f(a) \rfloor_{\Lambda} < 0$ ,  $\lfloor f(a) \rfloor_{\Lambda} = 0$  and  $\lfloor f(a) \rfloor_{\Lambda} > 0$ . Without loss of generalization, we consider the worst case where the error propagate in the same direction, i.e.  $\lfloor f(a) \rfloor_{\Lambda} < 0$ .

From this assumption, let  $y_1 = x - \frac{\Lambda}{2}$ ,  $y_2 = x + \frac{\Lambda}{2}$ , we know  $y_1 < 0$ ,  $y_2 < 0$ . Since  $f(a) + 1 = f(a')$ , we also have  $\lfloor f(a) \rfloor < \lfloor f(a') \rfloor$ . So, we know  $s$  can only be 1 for input  $a'$  but  $s$  can be 1 or -1 for input  $a$ .

For input  $a$ , let  $S = s$ ,  $L = e^{\epsilon(y_1 - f(a))}$  and  $R = e^{\epsilon(y_2 - f(a))}$ , we have  $\forall u \in (L, R)$ :  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{R}} [z \mapsto x]$ .

Let  $l$  and  $r$  be the range where  $\forall u \in (l, r)$  and  $S = s$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x]$ .  
We know:  $\underline{L} < l < \bar{L}$ ,  $\underline{R} < r < \bar{R}$  s.t.:

$$[U \mapsto l, S \mapsto s], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_1] \wedge [U \mapsto r, S \mapsto s], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_2].$$

Induction on  $s$ , we have when  $s = 1$ :

The transition from  $R$  to  $r$  given the transition environment  $\Theta = [U \mapsto (R_+, (\underline{R}_+, \bar{R}_+)), S \mapsto$

$(1, (1, 1))$  is shown as following:

$$\begin{array}{c}
\Theta, U \Rightarrow R_+, (R_+, \bar{R}_+) \\
\hline
\Theta, \ln(U) \Rightarrow \left( \ln(R_+), (\ln(R_+)(1+\eta), \frac{\ln(\bar{R}_+)}{1+\eta}) \right) \\
\hline
\Theta, \frac{1}{\epsilon} \ln(U) \Rightarrow \left( \frac{1}{\epsilon} \times \ln(R_+), \left( \frac{1}{\epsilon} \ln(R_+)(1+\eta)^2, \frac{1}{\epsilon} \frac{\ln(\bar{R}_+)}{(1+\eta)^2} \right) \right) \\
\hline
\Theta, f(a) + \frac{1}{\epsilon} \ln(U) \Rightarrow \left( f(a) + \frac{1}{\epsilon} \times \ln(R_+), \left( (f(a) + \frac{1}{\epsilon} \ln(R_+)(1+\eta)^2)(1+\eta), (f(a) + \frac{1}{\epsilon} \frac{\ln(\bar{R}_+)}{(1+\eta)^2})(1+\eta) \right) \right) \\
\hline
\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(R_+), (err_1, err_2))]
\end{array}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ . Then we can get following bounds for  $r$ :

$$R_+ = e^{\epsilon((y_2(1+\eta) - f(a))(1+\eta)^2)} , \bar{R}_+ = e^{\epsilon \frac{(\frac{y_2}{1+\eta} - f(a))}{(1+\eta)^2}} .$$

Since  $y_2 = \lfloor f(a) \rfloor + \frac{\Lambda}{2}$ , we have  $e^{\epsilon((y_2 - f(a)))} > 1$ , so actually we know  $R = r = 1$ .

We can also derive the bound for  $l$  in the same way as:

$$L_+ = e^{\epsilon((y_1(1+\eta) - f(a))(1+\eta)^2)} , \bar{L}_+ = e^{\epsilon \frac{(\frac{y_1}{1+\eta} - f(a))}{(1+\eta)^2}} .$$

When  $s = -1$ , we can derive following bounds in the same way for  $l$  and  $r$ :

$$L_- = e^{\epsilon((f(a) - y_2(1+\eta))(1+\eta)^2)} , \bar{L}_- = e^{\epsilon \frac{(f(a) - \frac{y_2}{1+\eta})}{(1+\eta)^2}} .$$

$$R_2 = e^{\epsilon((f(a) - y_1(1+\eta))(1+\eta)^2)} , \bar{R}_2 = e^{\epsilon \frac{(f(a) - \frac{y_1}{1+\eta})}{(1+\eta)^2}} .$$

Since  $y_1 = \lfloor f(a) \rfloor - \frac{\Lambda}{2}$ , we have  $e^{\epsilon((f(a) - y_1))} > 1$ , so actually we know  $R' = r' = 1$ .

For input  $a'$ , we have only one case where  $s = 1$ , the following bound can be derived:

$$R'_+ = e^{\epsilon((y_2(1+\eta) - f(a'))(1+\eta)^2)} , \bar{R}'_+ = e^{\epsilon \frac{(\frac{y_2}{1+\eta} - f(a'))}{(1+\eta)^2}} .$$

$$L'_+ = e^{\epsilon((y_1(1+\eta) - f(a'))(1+\eta)^2)} , \bar{L}'_+ = e^{\epsilon \frac{(\frac{y_1}{1+\eta} - f(a'))}{(1+\eta)^2}} .$$

We have following bounds on their ratios:

$$\frac{R_+}{R_-} = e^{\epsilon((1+\eta)^3 y_2 - (1+\eta)^2 f(a) - y_2 + f(a))} > e^{-3\epsilon B\eta} , \frac{\bar{R}_+}{R_+} = e^{\epsilon(frac{y_2}{1+\eta} - f(a) - \frac{f(a)}{(1+\eta)^2} - y_2 + f(a))} < e^{3\epsilon B\eta} ,$$

The same bound for  $L_+$  by substituting  $y_2$  with  $y_1$ , and similar bound for  $L', R'$ .

$$\frac{R'_+}{R_-} = e^{\epsilon((1+\eta)^2 f(a) - (1+\eta)^3 y_2 - f(a) + y_2)} > e^{-2\epsilon B\eta} , \frac{\bar{R}'_+}{R'_+} = e^{\epsilon(\frac{f(a)}{(1+\eta)^2} - frac{y_2}{1+\eta} - f(a) + y_2)} < e^{2\epsilon B\eta} ,$$

Using the bound on their ratios, we can get following bounds on  $|\bar{R}_+ - L_+|$  and  $|R'_+ - \bar{L}'_+|$ :

$$|\bar{R}_+ - L_+| < e^{3\epsilon B\eta} R_- - e^{-3\epsilon B\eta} L_+ < (R_- - L_+) e^{7\epsilon B\eta} , |\bar{R}'_+ - \bar{L}'_+| > e^{-2\epsilon B\eta} R'_+ - e^{2\epsilon B\eta} L'_+ > (R'_+ - L'_+) e^{-5\epsilon B\eta}$$

Then we have the following bounds on privacy loss:

$$\frac{2 - (L_+ + L_-)}{R'_+ - \bar{L}'_+} < \frac{\bar{R}_+ - L_+}{R'_+ - \bar{L}'_+} < \frac{e^{7\epsilon B\eta} (R_+ - L_+)}{e^{-5\epsilon B\eta} (R'_+ - L'_+)} = e^{12\epsilon B\eta + \epsilon}$$

**case**  $x \in (\lfloor f(a) \rfloor_\Lambda, \lfloor f(a') \rfloor_\Lambda)$

Since the output set  $(\lfloor f(a) \rfloor_\Lambda, \lfloor f(a') \rfloor_\Lambda)$  is empty when  $\Lambda \geq 1$ , so we consider the situation where  $\Lambda < 1$ . There are two subcases in this case :  $x > 0$  and  $x < 0$ . Without loss of generalization, we consider the worst case where error propagate in the same direction, i.e.,  $\lfloor f(a') \rfloor_\Lambda < 0$ . The bounds derived for  $l, r$  and  $l', r'$  under input  $a$  and  $a'$  are as follows:

For input  $a$ :

$$\underline{R} = e^{\epsilon((f(a)-y_2(1+\eta))(1+\eta)^2)}, \bar{R} = e^{\epsilon \frac{f(a) - \frac{y_2}{1+\eta}}{(1+\eta)^2}}.$$

$$\underline{L} = e^{\epsilon((f(a)-y_1(1+\eta))(1+\eta)^2)}, \bar{L} = e^{\epsilon \frac{f(a) - \frac{y_1}{1+\eta}}{(1+\eta)^2}}.$$

For input  $a'$ :

$$\underline{R}' = e^{\epsilon((y_2(1+\eta)-f(a'))(1+\eta)^2)}, \bar{R}' = e^{\epsilon \frac{\frac{y_2}{1+\eta} - f(a')}{(1+\eta)^2}}.$$

$$\underline{L}' = e^{\epsilon((y_1(1+\eta)-f(a'))(1+\eta)^2)}, \bar{L}' = e^{\epsilon \frac{\frac{y_1}{1+\eta} - f(a')}{(1+\eta)^2}}.$$

The bounds on their ratio are as follows:

$$\frac{\underline{R}}{\bar{R}} > e^{-5B\eta\epsilon}, \frac{\bar{R}}{\underline{R}} < e^{5B\eta\epsilon}; \quad \frac{\underline{R}'}{\bar{R}'} > e^{-5B\eta\epsilon}, \frac{\bar{R}'}{\underline{R}'} < e^{5B\eta\epsilon}.$$

And the bounds on  $|\underline{R} - \bar{L}|$  and  $|\bar{R}' - \underline{L}'|$  are as follows:

$$|\underline{R} - \bar{L}| > e^{-12B\eta\epsilon} |R - L|, |\bar{R}' - \underline{L}'| < e^{11B\eta\epsilon} |R' - L'|$$

So we have the privacy loss is bounded by:

$$\frac{|\underline{R} - \bar{L}|}{|\bar{R}' - \underline{L}'|} > \frac{e^{-12B\eta\epsilon} |R - L|}{e^{11B\eta\epsilon} |R' - L'|} = e^{-23B\eta\epsilon - \epsilon}$$

**case**  $x = \lfloor f(a') \rfloor_\Lambda$

This case is symmetric with the case where  $x = \lfloor f(a') \rfloor_\Lambda$ . It can also be split into 3 subcases by:  $\lfloor f(a') \rfloor_\Lambda < 0$ ,  $\lfloor f(a') \rfloor_\Lambda = 0$  and  $\lfloor f(a') \rfloor_\Lambda > 0$ . Without loss of generalization, we consider the worst case where the error propagate in the same direction, i.e.  $\lfloor f(a') \rfloor_\Lambda < 0$ .

From this assumption, let  $y_1 = x - (\frac{\Lambda}{2})$ ,  $y_2 = x + (\frac{\Lambda}{2})$ , we know  $y_1 < 0$ ,  $y_2 < 0$ . Since  $f(a) + 1 = f(a')$ , we also have  $\lfloor f(a) \rfloor < \lfloor f(a') \rfloor < 0$ . So, we know  $s$  can only be  $-1$  for input  $a$  but  $s$  can be  $1$  or  $-1$  for input  $a'$ .

For input  $a'$ , Let  $S = s$ ,  $L' = e^{\epsilon(y_1 - f(a'))}$  and  $R' = e^{\epsilon(y_2 - f(a))}$ , we have  $\forall u \in (L', R')$ :  $[U \mapsto u, S \mapsto s], \text{Snap}''(a') \Downarrow^{\mathbb{R}} [z \mapsto x]$ .

Let  $l'$  and  $r'$  be the range where  $\forall u \in (l', r')$  and  $S = s$ , s.t.  $[U \mapsto u, S \mapsto s], \text{Snap}''(a) \Downarrow^{\mathbb{F}} [z \mapsto x]$ . We know:  $\underline{L}' < l' < \bar{L}', \underline{R}' < r < \bar{R}'$  s.t.:

$$[U \mapsto l', S \mapsto s], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_1] \wedge [U \mapsto r', S \mapsto s], \text{Snap}'(a) \Downarrow^{\mathbb{F}} [y \mapsto y_2].$$

Induction on  $s$ , we have: When  $s = 1$ .

The transition from  $R'$  to  $r'$  given the transition environment  $\Theta = [U \mapsto (R'_+, (R'_-, \bar{R}'_+)), S \mapsto$

$(1, (1, 1))$  is shown as following:

$$\begin{array}{c}
\Theta, U \Rightarrow R_+, (R'_+, R'_+) \\
\hline
\Theta, \ln(U) \Rightarrow (\ln(R_+), (\ln(R'_+)(1+\eta), \frac{\ln(R'_+)}{1+\eta})) \\
\hline
\Theta, \frac{1}{\epsilon} \ln(U) \Rightarrow (\frac{1}{\epsilon} \times \ln(R_+), (\frac{1}{\epsilon} \ln(R'_+)(1+\eta)^2, \frac{1}{\epsilon} \frac{\ln(R'_+)}{(1+\eta)^2})) \\
\hline
\Theta, f(a) + \frac{1}{\epsilon} \ln(U) \Rightarrow (f(a) + \frac{1}{\epsilon} \times \ln(R_+), ((f(a) + \frac{1}{\epsilon} \ln(R'_+)(1+\eta)^2)(1+\eta), (f(a) + \frac{1}{\epsilon} \frac{\ln(R'_+)}{(1+\eta)^2})(1+\eta))) \\
\hline
\Theta, \text{Snap}'(a) \Rightarrow \Theta[y \mapsto (f(a) + \frac{1}{\epsilon} \times \ln(R_+), (err_1, err_2))]
\end{array}$$

From soundness theorem, we have  $err_1 \leq y_2 \leq err_2$ . Then we can get following bounds for  $r$ :

$$R'_+ = e^{\epsilon((y_2(1+\eta) - f(a'))(1+\eta)^2)}, \bar{R}'_+ = e^{\epsilon \frac{(y_2 - f(a'))}{(1+\eta)^2}}.$$

Since  $y_2 = \lfloor f(a) \rfloor + \frac{\Lambda}{2}$ , we have  $e^{\epsilon(y_2 - f(a))} > 1$ , so actually we know  $R'_+ = r'_+ = 1$ .

We can also derive the bound for  $l$  in the same way as:

$$L'_+ = e^{\epsilon((y_1(1+\eta) - f(a'))(1+\eta)^2)}, \bar{L}'_+ = e^{\epsilon \frac{(y_1 - f(a'))}{(1+\eta)^2}}.$$

When  $s = -1$ , we can derive following bounds in the same way for  $l$  and  $r$ :

$$L'_- = e^{\epsilon((f(a') - y_2(1+\eta))(1+\eta)^2)}, \bar{L}'_- = e^{\epsilon \frac{(f(a') - y_2)}{(1+\eta)^2}}.$$

$$R'_- = e^{\epsilon((f(a') - y_1(1+\eta))(1+\eta)^2)}, \bar{R}'_- = e^{\epsilon \frac{(f(a') - y_1)}{(1+\eta)^2}}.$$

Since  $y_1 = \lfloor f(a') \rfloor - \frac{\Lambda}{2}$ , we have  $e^{\epsilon(f(a') - y_1)} > 1$ , so actually we know  $R'_- = r'_- = 1$ .

For input  $a$ , we have only one case where  $s = -1$ , the following bound can be derived:

$$\underline{R} = e^{\epsilon(f(a) - (y_2(1+\eta))(1+\eta)^2)}, \bar{R} = e^{\epsilon \frac{(f(a) - y_2)}{(1+\eta)^2}}.$$

$$\underline{L} = e^{\epsilon(f(a) - y_1(1+\eta))(1+\eta)^2)}, \bar{L} = e^{\epsilon \frac{f(a) - y_1}{(1+\eta)^2}}.$$

We have following bounds on their ratios:

$$\frac{R'_+}{R'_+} = e^{\epsilon((1+\eta)^3 y_2 - (1+\eta)^2 f(a) - y_2 + f(a))} > e^{-3\epsilon B\eta}, \frac{\bar{R}'_+}{R'_+} = e^{\epsilon(frac{y_2(1+\eta)^3 - f(a)}{(1+\eta)^2} - y_2 + f(a))} < e^{3\epsilon B\eta},$$

The same bound for  $L'_+$  by substituting  $y_2$  with  $y_1$ , and similar bound for  $L, R$ .

$$\frac{\underline{R}}{R} = e^{\epsilon((1+\eta)^2 f(a) - (1+\eta)^3 y_2 - f(a) + y_2)} > e^{-2\epsilon B\eta}, \frac{\bar{R}}{R} = e^{\epsilon(\frac{f(a)}{(1+\eta)^2} - frac{y_2(1+\eta)^3 - f(a) + y_2}{(1+\eta)^2})} < e^{2\epsilon B\eta},$$

Using the bound on their ratios, we can get following bounds on  $|\bar{R}'_- - L'_-|$  and  $|\underline{R} - \bar{L}|$ :

$$|\bar{R}'_- - L'_-| < e^{3\epsilon B\eta} R - e^{-3\epsilon B\eta} L < (R'_- - L'_-) e^{7\epsilon B\eta}, |\underline{R} - \bar{L}| > e^{-2\epsilon B\eta} R - e^{2\epsilon B\eta} L > (R - L) e^{-5\epsilon B\eta}$$

Then we have the following bounds on privacy loss:

$$\frac{\underline{R} - \bar{L}}{2 - (L'_+ + L'_-)} > \frac{\underline{R} - \bar{L}}{\bar{R}'_- - L'_-} > \frac{e^{-5\epsilon B\eta}(R - L)}{e^{7\epsilon B\eta}(R'_- - L'_-)} = e^{-12\epsilon B\eta - \epsilon}$$

**case**  $x \in (\lfloor f(a') \rfloor_\Lambda, B)$

This case can also be split into 3 subcases symmetric with the case where  $x \in (-B, \lfloor f(a) \rfloor_\Lambda)$ :

**subcase**  $\lfloor f(a') \rfloor_\Lambda > 0 \vee \lfloor f(a') \rfloor_\Lambda < 0 \wedge x \in (0, B)$

let  $y_1 = x - \frac{\Lambda}{2}$ ,  $y_2 = x + \frac{\Lambda}{2}$ , we have  $y_1, y_2 > 0$ . The bounds derived for  $l, r$  and  $l', r'$  under input  $a$  and  $a'$  in this case are as follows:

For input  $a'$ :

$$\underline{R}' = e^{\epsilon \left( (f(a') - \frac{y_2}{1+\eta})(1+\eta)^2 \right)}, \bar{R}' = e^{\frac{\epsilon (f(a') - y_2(1+\eta))}{(1+\eta)^2}}.$$

$$\underline{L}' = e^{\epsilon \left( (f(a') - \frac{y_1}{1+\eta})(1+\eta)^2 \right)}, \bar{L}' = e^{\frac{\epsilon (f(a') - y_1(1+\eta))}{(1+\eta)^2}}.$$

For input  $a$ :

$$\underline{R} = e^{\epsilon \left( (f(a) - \frac{y_2}{1+\eta})(1+\eta)^2 \right)}, \bar{R} = e^{\frac{\epsilon (f(a) - y_2(1+\eta))}{(1+\eta)^2}}.$$

$$\underline{L} = e^{\epsilon \left( (f(a) - \frac{y_1}{1+\eta})(1+\eta)^2 \right)}, \bar{L} = e^{\frac{\epsilon (f(a) - y_1(1+\eta))}{(1+\eta)^2}}. \text{ The bounds on their ratio are as follows:}$$

$$\frac{\underline{R}}{\underline{L}} > e^{-3B\eta\epsilon}, \frac{\bar{R}}{\bar{L}} < e^{3B\eta\epsilon}$$

And the bounds on  $|\underline{R} - \bar{L}|$  and  $|\bar{R}' - \underline{L}'|$  are as follows:

$$|\underline{R} - \bar{L}| > e^{-7B\eta\epsilon} |R - L|, |\bar{R}' - \underline{L}'| < e^{7B\eta\epsilon} |R' - L'|$$

So we have the privacy loss is bounded by:

$$\frac{|\underline{R} - \bar{L}|}{|\bar{R}' - \underline{L}'|} > \frac{e^{-7B\eta\epsilon} |R - L|}{e^{7B\eta\epsilon} |R' - L'|} = e^{-14B\eta\epsilon - \epsilon}$$

**subcase**  $\lfloor f(a') \rfloor_\Lambda < 0 \wedge x \in (\lfloor f(a') \rfloor_\Lambda, 0)$

let  $y_1 = x - \frac{\Lambda}{2}$ ,  $y_2 = x + \frac{\Lambda}{2}$ , we have  $y_1, y_2 < 0$ . The bounds derived for  $l, r$  in this case are as follows:

For input  $a'$ :

$$\underline{R}' = e^{\epsilon \left( (f(a') - y_2(1+\eta))(1+\eta)^2 \right)}, \bar{R}' = e^{\frac{\epsilon (f(a') - y_2(1+\eta))}{(1+\eta)^2}}.$$

$$\underline{L}' = e^{\epsilon \left( (f(a') - y_1(1+\eta))(1+\eta)^2 \right)}, \bar{L}' = e^{\frac{\epsilon (f(a') - y_1(1+\eta))}{(1+\eta)^2}}.$$

For input  $a$ :

$$\underline{R} = e^{\epsilon \left( (f(a) - y_2(1+\eta))(1+\eta)^2 \right)}, \bar{R} = e^{\frac{\epsilon (f(a) - y_2(1+\eta))}{(1+\eta)^2}}.$$

$$\underline{L} = e^{\epsilon \left( (f(a) - y_1(1+\eta))(1+\eta)^2 \right)}, \bar{L} = e^{\frac{\epsilon (f(a) - y_1(1+\eta))}{(1+\eta)^2}}.$$

The bounds on their ratio are as follows:

$$\frac{\underline{R}}{\underline{L}} > e^{-5B\eta\epsilon}, \frac{\bar{R}}{\bar{L}} < e^{5B\eta\epsilon}$$

And the bounds on  $|\underline{R} - \bar{L}|$  and  $|\bar{R}' - \underline{L}'|$  are as follows:

$$|\underline{R} - \bar{L}| > e^{-12B\eta\epsilon} |R - L|, |\bar{R}' - \underline{L}'| < e^{11B\eta\epsilon} |R' - L'|$$

So we have the privacy loss is bounded by:

$$\frac{|\underline{R} - \bar{L}|}{|\bar{R}' - \underline{L}'|} > \frac{e^{-12B\eta\epsilon} |R - L|}{e^{11B\eta\epsilon} |R' - L'|} = e^{-23B\eta\epsilon - \epsilon}$$

**subcase**  $\lfloor f(a') \rfloor_\Lambda < 0 \wedge x = 0$

let  $y_1 = x - \frac{\Lambda}{2}$ ,  $y_2 = x - \frac{\Lambda}{2}$ , we have  $y_1 < 0$  and  $y_2 > 0$ . The bounds derived for  $l, r$  in this case are as follows:

For input  $a'$ :

$$\underline{R}' = e^{\epsilon \left( (f(a') - \frac{y_2}{1+\eta})(1+\eta)^2 \right)}, \bar{R}' = e^{\epsilon \frac{(f(a') - y_2)(1+\eta)}{(1+\eta)^2}}.$$

$$\underline{L}' = e^{\epsilon \left( (f(a') - y_1)(1+\eta)(1+\eta)^2 \right)}, \bar{L}' = e^{\epsilon \frac{f(a') - \frac{y_1}{1+\eta}}{(1+\eta)^2}}.$$

For input  $a$ :

$$\underline{R} = e^{\epsilon \left( (f(a) - \frac{y_2}{1+\eta})(1+\eta)^2 \right)}, \bar{R} = e^{\epsilon \frac{(f(a) - y_2)(1+\eta)}{(1+\eta)^2}}.$$

$$\underline{L} = e^{\epsilon \left( (f(a) - y_1)(1+\eta)(1+\eta)^2 \right)}, \bar{L} = e^{\epsilon \frac{f(a) - \frac{y_1}{1+\eta}}{(1+\eta)^2}}.$$

The bounds on their ratio are as follows:

$$\frac{\underline{R}}{\underline{R}'} > e^{-3B\eta\epsilon}, \frac{\bar{R}}{\bar{R}'} < e^{3B\eta\epsilon} \frac{\underline{L}}{\underline{L}'} > e^{-5B\eta\epsilon}, \frac{\bar{L}}{\bar{L}'} < e^{5B\eta\epsilon}$$

And the bounds on  $|\underline{R} - \bar{L}|$  and  $|\bar{R}' - \underline{L}'|$  are as follows:

$$|\underline{R} - \bar{L}| > e^{-8B\eta\epsilon} |R - L|, |\bar{R}' - \underline{L}'| < e^{8B\eta\epsilon} |R' - L'|$$

So we have the privacy loss is bounded by:

$$\frac{|\underline{R} - \bar{L}|}{|\bar{R}' - \underline{L}'|} > \frac{e^{-8B\eta\epsilon} |R - L|}{e^{8B\eta\epsilon} |R' - L'|} = e^{-16B\eta\epsilon - \epsilon}$$

**case**  $x = B$

We know  $s = -1$ ,  $L = l = 0$  and  $R = b$ , so we only need to estimate the right side range  $r$  in this case. The bounds derived for  $r, r'$  are as following:

$$\underline{R} = e^{\epsilon \left( (f(a) - \frac{x}{1+\eta})(1+\eta)^2 \right)}, \bar{R} = e^{\epsilon \frac{(f(a) - x)(1+\eta)}{(1+\eta)^2}}$$

$$\underline{R}' = e^{\epsilon \left( (f(a') - \frac{x}{1+\eta})(1+\eta)^2 \right)}, \bar{R}' = e^{\epsilon \frac{(f(a') - x)(1+\eta)}{(1+\eta)^2}}$$

The privacy loss of  $\text{Snap}(a)$  in this case is bounded by:

$$\begin{aligned} \frac{\frac{1}{2}(\underline{R} - 0)}{\frac{1}{2}(\bar{R}' - 0)} &= e^{\epsilon \left( \left( (f(a) - \frac{x}{1+\eta})(1+\eta)^2 \right) - \frac{(f(a') - x)(1+\eta)}{(1+\eta)^2} \right)} \\ &= e^{\epsilon \left( f(a)(1+\eta)^2 - x(1+\eta) - \frac{f(a)}{(1+\eta)^2} + \frac{x}{(1+\eta)} \right)} \quad (\star) \end{aligned}$$

Since  $1 + 2.1\eta > (1 + \eta)^2 > 1 + 2\eta$  and  $\frac{1}{(1+\eta)^2} > 1 - 2\eta$ , we have:

$$\begin{aligned} (\star) &> e^{\epsilon \left( (1+2\eta)f(a) - \frac{\eta(\eta+2)}{1+\eta}x - \frac{1}{1+2\eta}(f(a)+1) \right)} \\ &= e^{\epsilon \left( \frac{4\eta(\eta+1)}{1+2\eta}f(a) - \frac{\eta(\eta+2)}{1+\eta}x - \frac{1}{1+2\eta} \right)} \\ &> e^{\epsilon \left( -B\eta \frac{4(\eta+1)}{1+2\eta} + \frac{(\eta+2)}{1+\eta}x - 1 \right)} \\ &> e^{\epsilon(-6\eta B - 1)} \end{aligned}$$

□

\end{array}$$

Figure 6: Semantics of Evaluation in Floating Point Computation

## 7 Semantics - Functional

The transition semantics with relative floating point computation error are shown in Figure. 5. The semantics are  $e \Rightarrow (err)$ , which means a real expression  $e$  can be transited in floating point computation with error bound  $err$ ,  $\eta$  is the machine epsilon.

We assume the SAMPLE and F(D) semantics for floating point and real computation are the same.  $\mu \Downarrow \$ v$  represents  $v$  is sampled from the distribution  $\mu$ .

### Theorem 3 (Soundness Theorem)

Given  $e$  where the transition  $e \Rightarrow (\underline{e}, \bar{e})$  holds, then if  $e$  evaluates to  $c$  in floating point computation and

$$\begin{array}{c}
\frac{}{r \Downarrow r} \text{RVAL} \qquad \frac{e^1 \Downarrow r^1 \quad e^2 \Downarrow r^2 \quad r^1 * r^2 = r}{e^1 * e^2 \Downarrow r} \text{RBOP} \qquad \frac{e \Downarrow r', \quad \circ(r') = r}{\circ(e) \Downarrow r} \text{RUOP} \\
\\
\frac{c \leftarrow \mu^\diamond}{\leftarrow \$ \mu \Downarrow c} \text{SAMPLE} \qquad \frac{f(D) = c}{f(D) \Downarrow c} \text{F(D)}
\end{array}$$

Figure 7: Semantics of Evaluation in Real Computation

$\underline{e}$  and  $\bar{e}$  evaluates to  $\underline{r}$  and  $\bar{r}$  in real computation, we have:

$$\underline{r} \leq c \leq \bar{r}$$
